TITLE : ADIPOMETER

ABSTRACT : PROBLEM TO BE SOLVED: To provide an adipometer that can capture relation between a body fat ratio and a physical constitution index.

SOLUTION: A calculation unit of this adipometer calculates a body fat ratio, body fat quantity and a physical constitution index based on a body's partial impedance measured by an impedance measuring unit, a body weight weighed by a weighing unit and personal necessary data (height, age, sex) input by an inputting unit. A display part 4 is composed of a numeric display part 4a to display numerical values of the calculation results of the calculation unit and a graphic displaying part 4b to display graphics of the relation between a physical constitution index and a body fat ratio. The graphic displaying part 4b displays physical constitution indexes on the x-axis and the body fat ratio on the y-axis, then displays matrix calculation results of the calculation unit.
